Roadmap

Plans and Ideas for the future

Mathias Kettner & Lars Michelsen

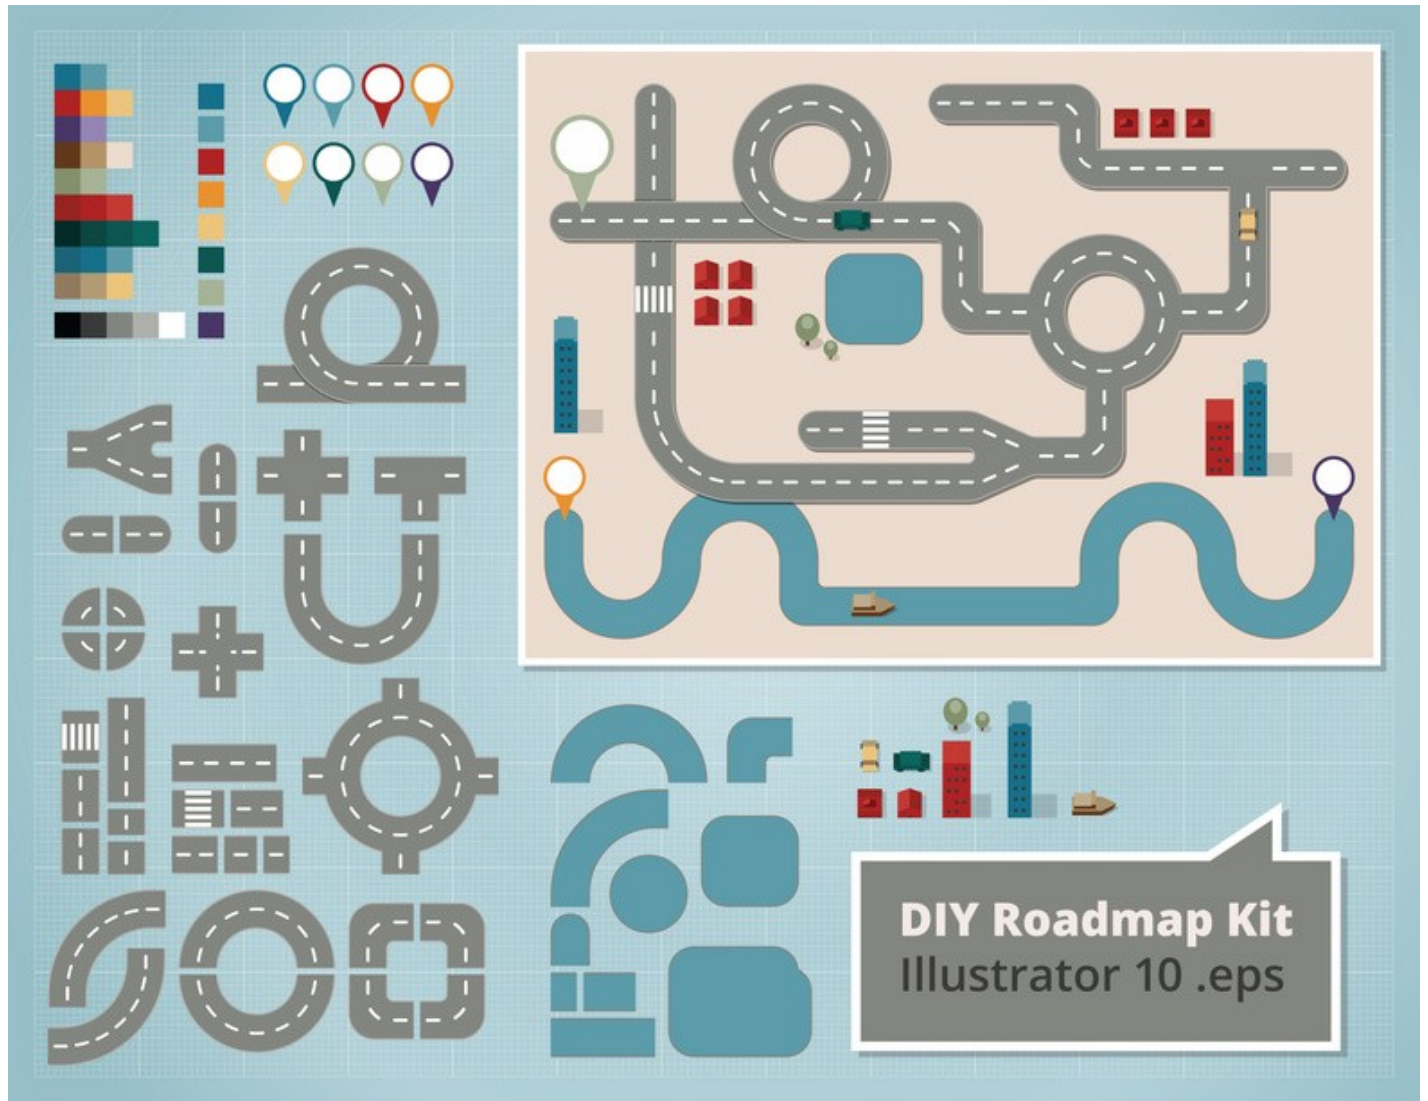

Our Roadmap

“The way forward is clear.”

Our Roadmap (2nd try)

Our roadmap is created by you

Actual demands of customers
have precedence
over our own bright ideas!

CHECK_MK
CONFERENCE #3

Already commissioned
THIS WILL COME FOR SURE

A cartoon illustration of a man in a dark blue suit and tie, smiling and looking upwards. He is holding a large, unrolled scroll that dominates the upper half of the frame. The scroll is white with a black border and contains the text 'Intelligent „Activate Changes“'. The background is a purple grid pattern.

Intelligent „Activate Changes“

Current problem with „Activate Changes“

- You cannot activate just **your** changes
- You cannot undo just your changes
- You cannot undo selected changes anyway

Another problem with changes

- Some things get immediately active, some not
- Local site behaves differently
- Restart of monitoring implicitly activates some changes

**Why do we need
to activate changes
in the first place??**

Advantages of „Activate Changes“

- Control the exact **time** when a set of changes gets active
- Chance to review changes and maybe roll back

New concept

- Selected changes can be activated while keeping others pending
- Selected changes can be rolled back while keeping others

Sounds easy?

Example 1:

1. Create a folder
2. Create a host in that folder
3. Roll back Change 1

→ Changes depend on each other!

Example 2:

1. Delete host myserver123
2. Create (new) host myserver123
3. Rollback change 1

→ Rollback of 1 would create invalid configuration with duplicate host!

Example 3:

1. Delete a rule
2. Roll back change 1

→ Changes need knowledge about the previous situation

Example 4:

1. Delete host myserver123
2. Create (new) host myserver123
3. Rollback change 1

→ Rollback of 1 would create invalid configuration with duplicate host!

Implementation (1)

- Each change is an (intelligent) object that can apply / rollback itself
- And it can be saved / loaded on disk.
- Changes know about dependencies to other changes

Implementation (2)

- WATO will be reorganized internally so that everything it does is such a change.

WATO Web-API is the lucky guy

- Due to this formalization of changes **every** WATO operation will be available via the API

A cartoon illustration of a man in a dark blue suit and white shirt, smiling and holding up a large, unrolled scroll. The scroll is white with a black border and contains the text 'Time controlled check parameters' in a bold, dark blue font. The background is a purple grid pattern.

Time controlled check parameters

Check parameters

- Changing parameters based on time
- Can be used with all Check_MK checks
 - „Parameters for discovered services“
- Transparent for checks
 - Check gets the current parameters

How to specify the time?

- We are using time periods
- Problem:
Only admins can configure time periods
- Solution:
Make them configurable by users

A cartoon illustration of a man in a dark blue suit and white shirt, smiling and holding up a large, unrolled scroll. The scroll is white with a black border and contains the text 'Structured status data' in a bold, dark blue font. The background is a purple grid pattern.

Structured status data

Make checks produce more useful data

- We capture a lot of data
- Why not make it better usable?
- Example:
 - Export current database usage together with database inventory information

Status Quo

- Checks: Status code, text, perfdata
- HW/SW-Inventory: Structured data

OK	CPU load	 	OK - 15 min load 0.32 at 8 Cores (0.04)
OK	CPU utilization	 	OK - user: 2.7%, system: 0.6%, wait: 0
OK	CUPS Queue officejet-daniel	 	OK - is idle. enabled since
OK	CUPS Queue officejet-diana	 	OK - is idle. enabled since
OK	Disk IO SUMMARY	 	OK - Utilization: 0.0%, Re Average Read Wait: 0.00 Queue Length: 0.00

VS.

 Hardware

▼ Arbeitsspeicher (RAM)

Gesamter Auslagerungsspeicher	15.88 GB
Gesamter verfügbarer Arbeitsspeicher	15.55 GB
Virtuelle Adressraum für Mappings	31.00 TB

 Netzwerk

Hostname	Klappspaten
Ports	1
Schnittstellen	3
Verfügbare Ports	0

▶ Schnittstellen

Extend HW/SW inventory?

- Status data is captured often
- Data can change each interval

→ Conflict with HW/SW inventory history
(differential mode)

How to?

- New check function „data_function“
 - Extends a tree with own data
- Status GUI: Merges both trees
- Export merges data optionally

CHECK_MK
CONFERENCE #3

Plans

WE PROBABLY WILL DO THIS

Tickets via GUI

Make ticketing less painful

- Takes time: Collecting needed information
 - Meta data (OS, Check_MK version, ...)
 - Mandatory diagnose information
- Could be improved with some kind of guided ticket creation

GUI Integration

- Add a ticket creation module
- Dynamic form with mandatory fields based on categories
- Components: Core, GUI, Event Console, ...
- Categories: Bug, Configuration problem, Performance, Development

Example: Check development request

- Ask all common questions
 - What to monitor?
 - How to get data?
 - Provide MIBs
 - WATO configuration needed?
 - Metrics needed?
 - ...?

A cartoon illustration of a man in a dark blue suit and white shirt, smiling and looking upwards. He is holding a large, unrolled scroll that fills most of the frame. The scroll is white with a black border and has the word "Performance" written in a bold, dark blue font in the center. The background is a purple color with a white grid pattern.

Performance

Check_MK Check Helper Memory

- Get deeper understanding
 - Need real environments for this
 - Measure
- Possibly change helper model

Improve Liveness Proxy scaling

- We need more than 300 sites
- Limits:
 - Number of file descriptors, Python GIL
- Change to multi process architecture

Apache / GUI

- A lot of load is caused by inactive sessions (hidden tabs / windows)
- Disable update while inactive
- Restart the update again when focused

CHECK_MK
CONFERENCE #3

Ideas and Dreams

MIGHT OR MIGHT NOT COME TRUE

A cartoon illustration of a man in a dark blue suit and tie, smiling and looking upwards. He is holding a large, unrolled scroll that fills most of the frame. The scroll is white with a black border and has the text 'SLAs' written in a large, bold, dark blue font in the center. The background is a purple color with a white dot pattern.

SLAs

Current functionality:

Host	Service	OK	WARN	CRIT	UNKNOWN
Lastrechner	Filesystem /	83.52%	16.30%	0.16%	0.00%
Lastrechner	Filesystem /bauwelt	95.15%	0.87%	3.97%	0.00%
Lastrechner	Filesystem /chroots	99.44%	0.18%	0.37%	0.00%
Lastrechner	Filesystem /boot	99.99%	0.00%	0.00%	0.00%
Lastrechner	Filesystem /opt/omd	95.61%	4.15%	0.22%	0.00%
Summary		94.74%	4.30%	0.94%	0.00%

- Precise analysis of actual availability
- Many ways to tune computation
- Also for BI aggregations
- Simplistic „SLA“-Check, just coloring cells according to percentages

Real SLA can be much more complex.

Idea - step 1:

- New GUI module for specifying more complex SLAs
 - Based on different timeperiods
 - Also number, length of outages
 - expandable in a modular way
- Edited by users just like views and reports.

Idea - step 2:

- Assign these SLAs to hosts and services via rules
- Assign to BI aggregates via BI module

Idea - step 3:

- View have new optional columns for showing SLA status
- Not only yes / no, but also **amount** of (under-)fullfillment
- Also available in the **current** time period.

Idea - step 4:

- **Actual SLA-Monitoring**
- E.g. gets you warned if your **allowed** downtime for the current period is running low.
- **Helps you fullfulling your SLAs!**
- **Helps you planning downtimes.**
